Time-Critical Spare-Parts Logistics, Built For The Night.

A B2B SaaS control tower for in-night logistics across the Nordics, the Baltics and Poland. Predicts SLA risk before it breaches, pre-positions inventory before demand spikes, and reroutes around disruption in seconds — not phone calls.

FOR DANX CAROUSEL GROUP PREPARED BY CODEUPSCALE · PRE-SALES BRIEF

• PART I

What's broken in the night shift today.

Time-critical spare-parts logistics is a discipline that lives between 22:00 and 07:00 — the window that holds a hospital MRI, a factory line, a wind turbine, and a fleet of service vans together. When it goes well, no one notices. When it breaks, six different people get phone calls before anyone agrees on what happened.

01

No single command view across seven countries.

Dispatchers stitch together TMS, WMS, telematics and three weather feeds in browser tabs. When a customer asks *"where is my part?"* the answer lives in three different systems.

02

SLA breaches detected after they happen.

The first signal of a missed pre-07:00 window is usually the customer's call. By then the technician is on site, the part isn't, and the downtime clock is already running.

03

FSL stockouts cost the customer, not the carrier.

A brake-actuator shortage in Gothenburg costs Volvo Trucks €4.2k per hour of line-down time. A life-sciences part missing in Berlin costs €48k per hour. Stockouts are knowable 24–48h in advance — but no one looks until it's too late.

04

Disruption response is 90 minutes of phone calls.

E18 closes for three hours; 47 routes are affected; the dispatcher calls hubs, drivers and PUDO partners one at a time. Priority deliveries are kept on instinct, not policy.

05

Vertical rules live in spreadsheets.

Life-sciences cold-chain handling, auto line-down priority, agri rural drop windows — every vertical has its own SLA, every customer has their own override. None of it is encoded in software.

06

Customer reporting is a Thursday-night spreadsheet.

Account managers export from three systems, paste into a deck, and email it at 23:00 on Thursday. The numbers are 36 hours stale by the time the customer reads them.

• PART II

One product, one operating layer.

Nordline Intelligence is the missing layer between TMS, WMS, telematics and the dispatcher's instinct. It listens to every system that already exists in your network, applies a single predictive model on top, and gives every role — dispatcher, hub manager, account lead, executive — the view they actually need.

Three things make this distinct from a TMS.

- **In-night model.**

SLA *pre-07:00* windows are . The customer is a field engineer, not a household. Every screen knows this.

- **Spare parts as a cargo class.**

Small, high-value, high-criticality. One missed part is a hospital,

The economic argument

€127k downtime exposure avoided per week, anchor customer

96.8% SLA hold rate vs. 96% renewal floor

4s to recalculate 47 routes around a closure

−18% failed-delivery cost, week over week a factory line, or a turbine offline.

- **Vertical-aware.**

Auto, life sciences, renewables, agri, industrial — each with distinct SLA windows, downtime cost, and handling rules. Encoded, not improvised.

What the platform replaces.

TODAY	WITH NORDLINE
3-4 dispatcher tabs (TMS, WMS, telematics, weather)	One control tower with country drill-down
Breach detection by customer phone call	Breach *prediction* 4–8 hours upstream
Stockout discovery on the day of shortage	34-hour stockout forecast with auto-replenishment plan
90-minute disruption phone-call cascade	4-second recalculation, priority shipments preserved

TODAY	WITH NORDLINE
Three-person investigation: *"why is tonight risky?"*	One sentence to the AI assistant, grounded in tonight's data
Thursday-night customer deck assembly	Auto-generated customer report, Friday 09:00 to inbox

• PART III

The seven screens.

Each screen answers a question a real role on the night-ops floor asks. Every one of the six pain points above is solved somewhere in this sequence.

01

CONTROL TOWER · HERO SCREEN

The Night, At A Glance.

SOLVES PAIN 01

Who it's for: Dispatchers and hub managers, 22:00–07:00.

Purpose: Show the entire seven-country network in one view — every shipment, hub, FSL, PUDO and active route — with the at-risk ones surfaced visibly. Country filter narrows the scope without breaking the story. Click any node, drill into pick rate, cross-dock queue and labor status without leaving the screen.

Replaces the 3-tab dispatcher workspace. The answer to "where is everything right now?" goes from four minutes to two seconds.

02

SLA RISK PREDICTION

Predict, Then Prevent.

SOLVES PAIN 02

Who it's for: Dispatchers and account managers under SLA pressure.

Purpose: Score every in-flight shipment 0–100 on breach probability, decompose the score into its six contributing factors (weather, hub backlog, driver availability, traffic, lane history, customer window), and recommend a concrete intervention that the dispatcher can accept in a single click.

Move from reactive ("the customer called") to proactive ("we acted three hours ago").

03 INVENTORY INTELLIGENCE

Stage Tomorrow's Parts Tonight.

SOLVES PAIN 03 & 05

Who it's for: FSL managers, supply planners, account leads.

Purpose: Predict stockouts 24–48 hours in advance per SKU per FSL, recommend an overnight replenishment move (source hub, units, truck slot, arrival, cost), and switch SLA & handling rules instantly by industry vertical (auto → life sciences → renewables → agri → industrial → materials → consumer). One pill click swaps the entire rule profile and refilters the SKU table.

A €312 truck move avoids €48k of customer downtime exposure. The math defends itself.

04 IN-NIGHT ROUTE OPTIMIZATION

Five Hundred Routes. Four Seconds.

SOLVES PAIN 04

Who it's for: Dispatchers and operations directors facing live disruption.

Purpose: Inject a real-world closure (E18 Stockholm–Oslo) and watch every affected route reweave around it without losing a single technician delivery. The before/after panel updates distance, CO_2, network cost and SLA preservation live; the per-route cards show which deliveries detoured and which kept their ETA. A Fleet & Driver card shows utilisation, hours-of-service and cost per shipment shift with the disruption.

Replaces the 90-minute phone-call cascade with a four-second optimisation.

05 AI OPERATIONS ASSISTANT

Ask The Night.

REDUCES FRICTION ACROSS ALL PAINS

Who it's for: Dispatchers, managers, and account leads who need an answer faster than a Slack message.

Purpose: Replace the three-person investigation with one sentence. The assistant is grounded in tonight's shipments, route plans, weather feeds and ninety days of SLA history. Every answer comes with an evidence list, recommended actions, and a single *Apply All* control. Free-form questions route by topic; suggested prompts cover the four highest-value dispatcher questions.

The question your dispatcher used to phone three people to answer — now in a single sentence, with the action pre-staged.

06

CUSTOMER PERFORMANCE REPORT

A Quiet Week. By Design.

SOLVES PAIN 06

Who it's for: Account leads and the customer's own operations executives.

Purpose: Auto-generate a publication-quality weekly performance report for each enterprise customer. Cover & pull-stats, 12-week SLA trend against the renewal floor, exception breakdown by cause, cost-to-serve, notable saves, and a three-line analyst recommendation for next week. Exports to PDF, schedules to Friday 09:00 delivery, shares as a read-only portal link.

Account managers reclaim Thursday night. Customers see value before they ask for it.

07

INTEGRATION & ARCHITECTURE

The Connectors Underneath.

ANSWERS THE IT QUESTION

Who it's for: IT stakeholders, integration architects, the buyer's CIO.

Purpose: Show that Nordline does not replace TMS, WMS or ERP — it sits on top of them as an event-driven operating layer. Eight live connectors (TMS, WMS, ERP, telematics, PUDO, POD, weather, traffic), an event-choreography trace showing one pick → five updates in under a second, and three cross-cutting capabilities (multi-country/multi-currency, audit-logged, role-based dashboards).

Answers the "how does this fit our SAP and our existing TMS?" question visually.

PART IV

Scope at pilot.

Built to a deliberately realistic operational footprint so the demo never feels like a toy.

OPERATIONAL ELEMENT	PILOT SCALE
Countries / regions	7 — Denmark, Sweden, Norway, Finland, Estonia, Latvia, Lithuania, Poland
Hubs	56 across all seven countries
Forward Stock Locations (FSL)	29 distributed by demand density
PUDO & locker points	86 (urban + rural)
Active nightly routes	500
Annual shipment volume modeled	1.8M
Spare-parts SKUs	10,000 across 7 verticals
Customer accounts	250 (incl. Siemens Healthineers, Volvo Trucks, John Deere, Vestas, ABB)
SLA history horizon	12 months of tonight's-equivalent shipment + exception history

Industry verticals supported.

VERTICAL	SLA WINDOW	DOWNTIME COST / HR
Life Sciences & Medical	4h	€48,000
Renewable Energy	8h	€11,200
Industrial Machinery	6h	€9,500
Automotive Spare Parts	8h	€4,200
Materials Handling	10h	€2,400
Agriculture Equipment	12h	€1,800
Consumer Service Parts	14h	€600

How the 14 capability areas of the brief are covered.

CAPABILITY	SCREEN
1. Control Tower	01 (hero)
2. AI SLA Risk Prediction	02
3. In-Night Route Optimization	04
4. FSL / Hub / PUDO Inventory	03
5. Warehouse & Cross-Dock Operations	01 — embedded in hub drawer
6. Time-Critical Exception Management	02 — risk queue doubles as exception queue
7. Customer & Technician Portal	06 (customer view)
8. Industry-Specific Verticals	03 — pill row swaps rules live
9. Predictive Demand Planning	03 — 30-day forecast per SKU
10. Fleet, Driver & Route Analytics	04 — Fleet & Driver card
11. AI Operations Assistant	05
12. Reporting & Executive Dashboards	06
13. Integration / Architecture	07
14. Pilot Sample Data	Powers all screens

• CLOSING

Why this story works for DANX.

Three reasons this product fits the DANX network specifically, today.

• ONE

The in-night model is the moat.

Every competitor sells a TMS or a WMS. None of them encode the pre-07:00 model, the technician-first sequencing, or the secure-drop and PUDO chain as first-class concepts. Nordline does, because it was built only for this.

• TWO

Predictive over reactive.

DANX customers don't care that you logged the breach. They care that the part arrived. Every screen in this product is biased toward the upstream intervention — the move that prevents the conversation.

• THREE

Vertical-aware out of the box.

Siemens cold chain. Vestas turbine downtime. John Deere harvest seasonality. Each lives as a profile, with its own SLA, its own escalation rules, its own report. The dispatcher doesn't need to remember which customer cares about what.

Recommended next step.

A four-week shaped pilot scoped to **one Nordic country, one corridor, one anchor customer**. We co-instrument the integration layer (TMS + WMS read-only) and stand up Screens 01, 02 and 03 against tonight's live data — enough to demonstrate breach prediction value within the pilot window.

Weeks 1–2: integration & data shape · Weeks 3–4: shadow-mode operation with the night-ops team · Week 5: review & renewal-or-roll.

Pilot success metrics

- Breach prediction lead time ≥ 3 hours (median)
- SLA hold rate +0.5 percentage points vs. baseline
- FSL stockout prevention > 3 events in the pilot window
- Dispatcher console-switching time −60% during ops shift
